from whiteboard
Git(Hub) + RStudio
session

LOCAL to your computer	**in the CLOUD**
a directory (= an RStudio Project) = a Git repository	a GitHub repository

|	**LOCAL** to your friend's computer
	a directory (= an RStudio Project) = a Git repository

Making things easier:

RStudio makes the R coding nicer

RStudio or SourceTree or GitHub for Mac or GitHub for Windows make using Git easier for novices

Good to know:

full Git power comes at the command line

there are other ways to host Git repos on the web, such as Bitbucket or your own Git server
